Automation

Persona

Persona is a personalisable AI news aggregator with no UI. You interact with it via chatbot, and it will ask for or deduce your credentials, email address, topics of interest, and build a personalized newsletter sent on an adaptable schedule.

This project does not exist yet.

Your goal for this project is to use N8N to build workflows that will bring this project to life.

N8N

N8N is an open-source workflow automation tool. It doesn't require code, but can integrate it. It provides you with a lot of official nodes and has a thriving community.

You are allowed to use community nodes for this project.

N8N is free when hosted locally, which is our recommendation for this project.

N8N gives access to a lot of AI tools, which can be plugged to different models (again, local or online). You can choose the one that best suits your needs.

Don't forget that as a student you have access to a lot of free tokens with some models

However, the model's quality is not a factor in the evaluation of this project

Important points

Interface

Your N8N workflow must have a Chatbot trigger node that can be used for any usage. You must design a way to impeach malicious actors from accessing personal data, other users's configuration files and admin privileges.

This implies that you must create an user authentication process inside of your workflow, and test it thoroughly.

It also means that any features you could add in the future should be adapted to work with this system.

You could add other trigger nodes that might be more practical for certain tasks, but your workflow must work without them.

Features

A user **must** be able to :

- Ask for a newsletter via the chatbot trigger
- Give centers of interest
- Provide their email address
- Ask for a timeframe where the newsletter would be ideal for them

Your workflow **must**:

- Fetch news stories from multiple sources
- Decide which news is interesting for which user
- Send a newsletter with links and summaries for each story at the time chosen by the user to their email address
- Attempt to follow basic RGPD guidelines (are you allowed to store email addresses? How can a user unsubscribe from their newsletters?)
- Protect itself against malicious users

Additional Features

Here is a list of features that **should** be implemented once your workflow is functional.

All those features have an indicator of their value that can help you prioritize and select which ones you want to implement.

A user **could** be able to :

- Set, choose or be assigned a personalized prompt for their newsletter, requiring more or fewer news stories, a different format, a different tone...
- Pay for a better product (or after a free-trial period)
- Comment on their past received newsletter and request changes for the next one. (ex: I didn't like the third news story, please don't use this source in the future)
- Reference another user via their pseudo and see information the user in question set as public

A different type of user **could** be able to:

- Ask their ads to be displayed in the newsletters of a subset of users (ex: people interested in science). This poses additional RGPD and user-experience challenges.

Your workflow **could**:

- Fact-check news stories against additional sources or by other means
- Write newsletters that take advantage of HTML email format instead of plaintext ones
- Provide other means to receive the newsletter and adapt it for each format (Blog post, social media post, printable version...)
- Use generative AI or store sources to provide multi-media newsletters
- Be usable via real exposed endpoints (website, discord channel, email...)

You **could**:

- Provide a "Security audit" of your workflow
- Provide proof that you are fully RGPD-compliant
- Optimize parts of your workflow to minimize time costs and token usage.
- Use tools like RAGs and MCP servers to augment your AI Agent's capacities.

Keynote

Your project will be evaluated via a Keynote, during which you **must** demo your features. Your keynote will be your answer to a (pretend) call for tenders. The people that (pretend) put this call up didn't specify which tool you were or weren't allowed to use, so you will have to justify your (pretend) boss's choice (the use of N8N) in this context. You've received an email from your (pretend) product manager about this :

Subject: Focus Areas for the Persona Project

Hi Team,

From the client brief I keep seeing the same points repeated – a single chat-bot trigger, secure handling of user credentials and personal data, real-time news fetching and filtering, and a clean, scheduled email newsletter. Those are the core pieces they want nailed down first.

Let's keep our prototype tight around those items. Also, they're based in the US but they might want to use their product in Europe too in the future, so we should start working a bit on that GDPR thing.

Exported workflow JSON files include credential names and IDs. While IDs aren't sensitive, the names could be, depending on how you name your credentials. HTTP Request nodes may contain authentication headers when imported from cURL. Remove or anonymize this information from the JSON file before sharing to protect your credentials.
